

SUPERText®

For Litigation Support, Investigation and Case Management

SUPERText continues its leadership tradition in Version 6.

SUPERText is a research, management and presentation system for the paper documents, electronic documents and other types of information in one or more of your projects. SUPERText users are applying SUPERText in their civil litigation, criminal investigation, criminal litigation, and general project research applications.

SUPERText goes well beyond most document management systems by providing you with sophisticated analytical capabilities. SUPERText's job is not finished when it searches and locates the documents that satisfy your query. SUPERText lets you add fields of information to the

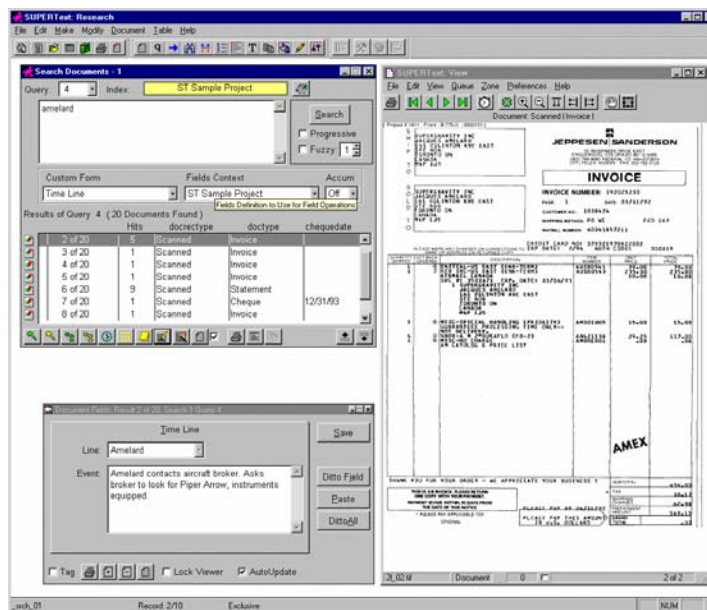

documents or to any specific pages or zones within the document. SUPERText lets you store and categorize information that may in fact not even be related to any specific document.

SUPERText provides you with sophisticated tools to prepare briefs or digests from your project material, to prepare and print structured reports listing information of interest from your project material and to work in tables and forms.

To the new user SUPERText provides instant productivity with its automated reports, automated forms and easy to use searching. For the more sophisticated user or system administrator SUPERText provides powerful customization tools that enable the definition and

creation of custom report designs, custom form designs, templates and custom project "data dictionaries."

SUPERText merges the best of imaging technology with the best of full-text search technology and the best of structured database technology. It is this combination of three powerful technologies that lets you best handle real projects. This means that all information, whether from a document's original content, or from a field or note you have attached to a document, page or zone, or from an entry that you have made, unrelated to any specific document, can be searched with the same, straight-forward and English-like full text query. And, because SUPERText is an imaging technology, your project's paper documents are one-click away.

SUPERText: Three Integrated Technologies at Your Service

SUPERText is built for the investigation, research and preparation of large-document cases and projects.

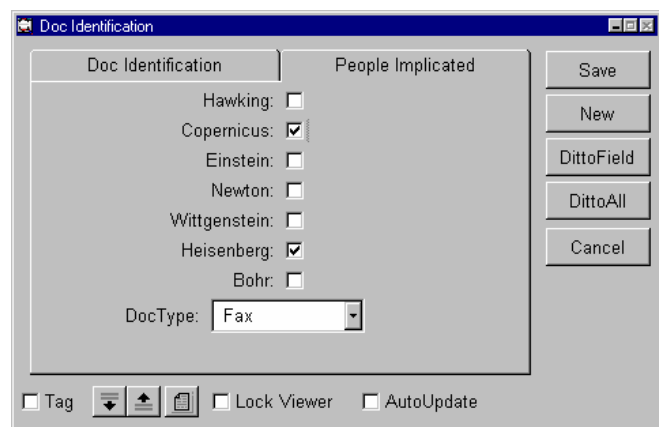

Because SUPERText is *content-based*, it is a vital intelligence source for your project objectives. SUPERText locates, displays and prints project documents, which it searches for on the basis of any of their content or fields. For example, all documents that contain a reference to "Account 175932" can be found. Over 90% of SUPERText's intelligence comes automatically with no key word entry required from the project team.

SUPERText's powerful structured database permits the association of fields to documents, fields to pages, and fields to zones, and prepares printed reports based on these fields. Fields do not require any pre-definition and are free from the restrictions inherent in traditional structured databases: *different documents can contain different fields*, an unlimited

number of fields with unlimited content.

You locate documents using SUPERText's searching capabilities and, *at any time*, can add your "analytical work-product" to retrieved documents. You are not required at the start of your project to anticipate the things that will turn out to be important or that

notes, cross-references, time-line links or references to prior testimony. SUPERText lets you define new *Templates* or *Views*: at any time; you merely specify what categories of information you wish to associate with a View and SUPERText automatically represents these categories of information in a Fields Window. And you use SUPERText's

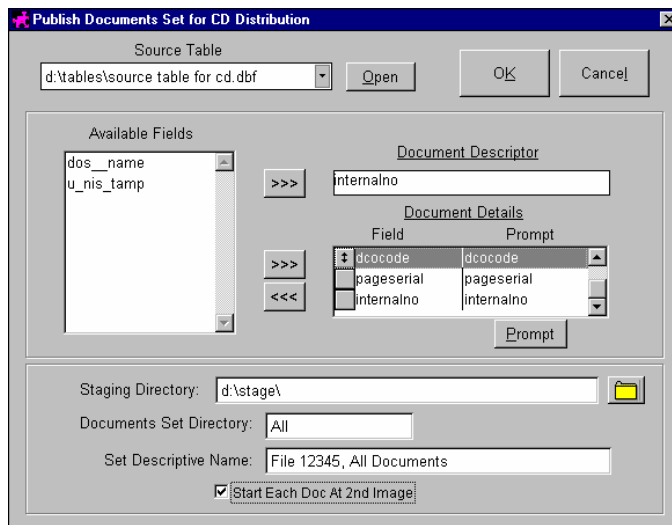

you will later want to track. There is no restriction on the types of information you choose to associate with documents. For example, you can add general

powerful searching features to locate *any information* in your project – it does not matter whether the information was originally in the document or whether it was associated by you to the document, page or zone.

SUPERText also makes it easy to define document sets and page sets thus making it extremely efficient for you to prepare trial books, witness kits and cross-examination files.

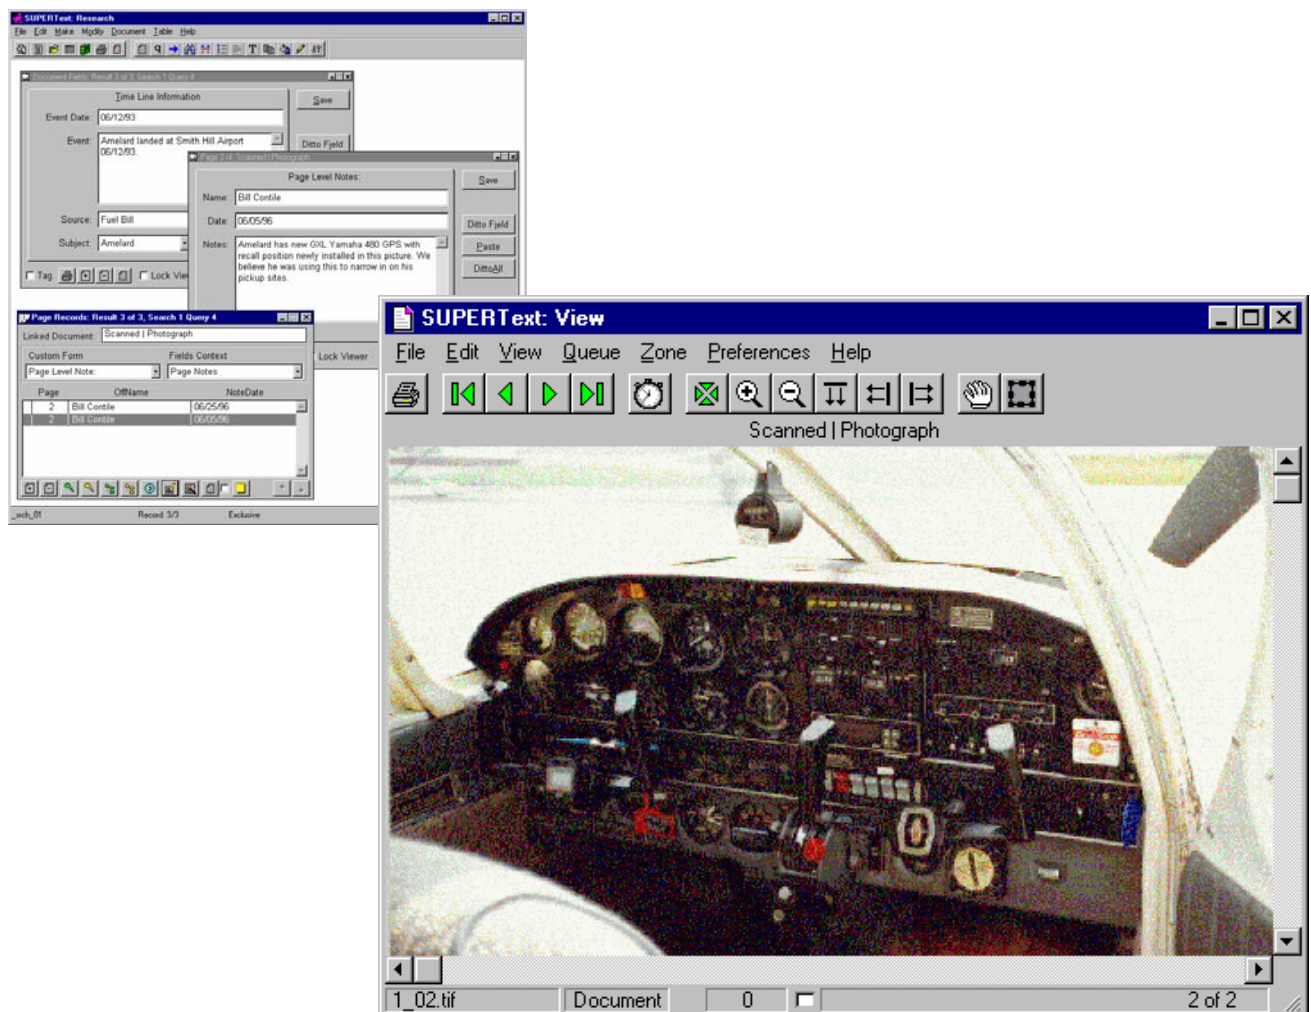

Appl_date	Event	Docrectype
19900601	Date booked by Amelard for trip to Regina	Scanned
19900625	Amelard in Los Angeles, at Centry Plaza hotel, unitl June 27th	Scanned
19900827	Amelard contacts aircraft broker. Asks broker to look for Piper Arrow, instruments	Scanned
19900900	In September of 1990, Amelard held meetings in Regina	Scanned
19900917	Amelard at Delta hotel in Regina	Scanned

Share Your Project on CD and Present It

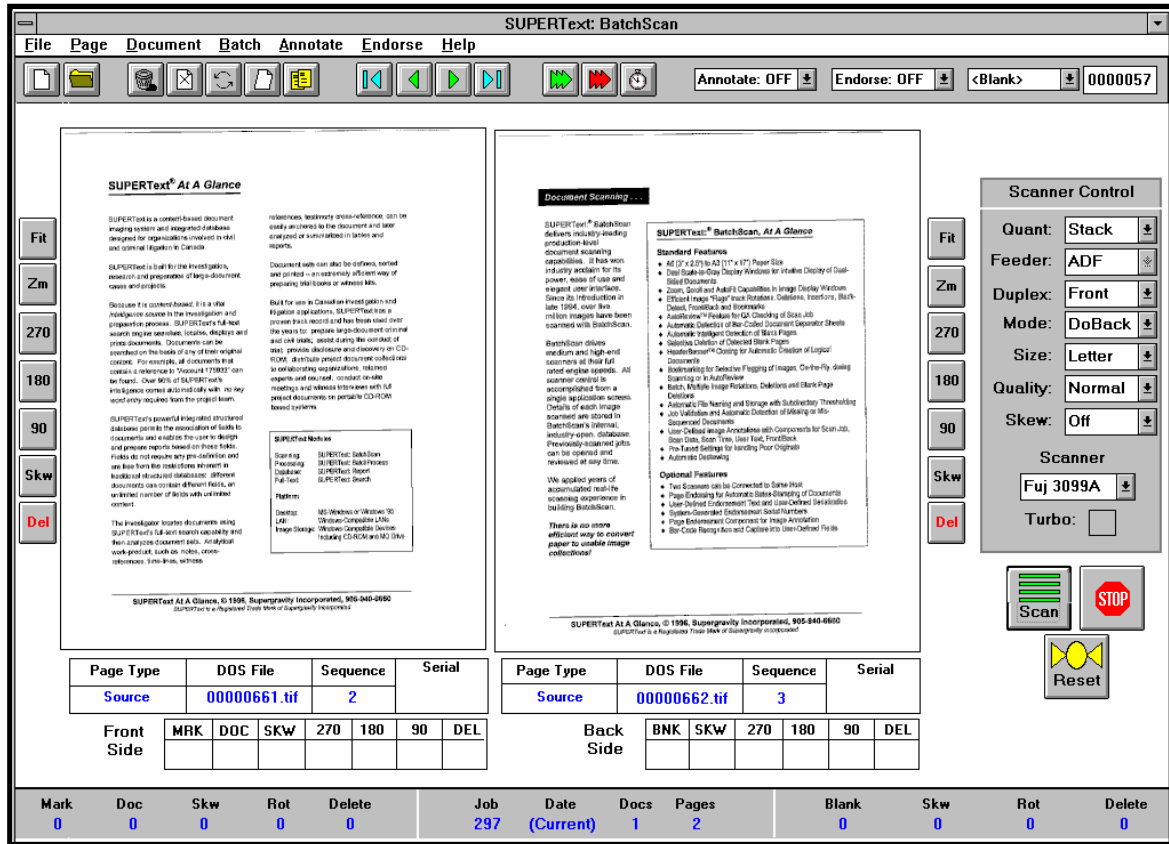

You can publish and distribute CD-ROM discs that contain documents you have scanned into your SUPERText project. SUPERText makes the process easy. SUPERText embeds in the CD the software that the recipient will require to work with the CD you have given him.

You can use SUPERText to present your project, for example, in court. You configure SUPERText to show only what you want to present and you also have a full set of tools to customize presentation format.

Production-Level Document Scanning and Processing

SUPERText: delivers industry-leading production-level document scanning capabilities. It has won industry acclaim for its power, ease of use and elegant user interface. Since its introduction in late 1994, users have scanned over twenty million images with SUPERText.

SUPERText drives medium and high-end scanners at their full

rated engine speeds. All scanner control is accomplished from a single application screen. Details of each image scanned are internally stored in an industry-open, database. Previously-scanned jobs can be opened and reviewed at any time.

Scanned documents are processed in SUPERText in a fully automated and unattended batch

mode. You use SUPERText's efficient processing queues to specify the scanned material you wish processed into your projects.

We applied years of accumulated real-life scanning experience in building the scanning component of SUPERText.

In business since 1983, Supergravity has delivered hundreds of leading microcomputer based imaging and litigation support solutions in both the Public and Private sectors. We understand the needs of organizations involved in the litigation process in Canada and apply our know-how to ensure the success of each installation; Jacques I. Amelard, Supergravity's founder and chief product architect is a lawyer. Backed by a team of computer professionals, Supergravity delivers uncompromising dedication and support to ensure that you continue to reap the benefits of your technology investment.
